

User Guide for Finder

Developed by New Rock Technologies, Inc., Finder is a Windows-based software for obtaining the IP address of New Rock products, especially FXO devices, in a LAN environment.

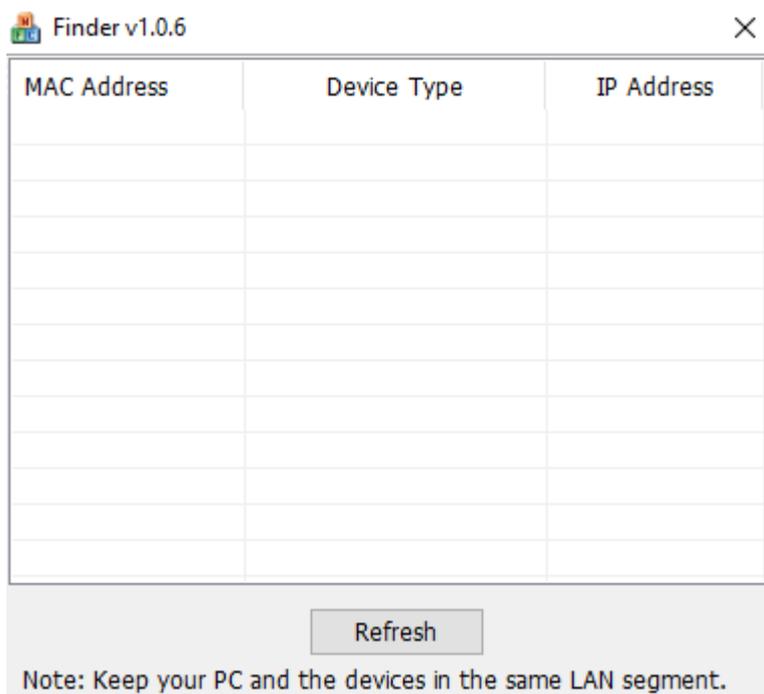

Here are the steps to use Finder:

1. Download Finder from <http://en.newrocktech.com/show/594.html>.
2. Double click the software to run it.

Note: If a popped up message prompts you to install WinPcap, click OK.

3. Click **Refresh**.

You can identify your device from the MAC-IP address list by checking the device MAC and find the corresponding IP address.

Note: Make sure your PC and the target device is in the same LAN segment. If it fails to find the target device you may connect your PC directly to the Ethernet port on the target devicet and try again.
